

ID	Module	Functional / Non-Functional	Description	Priority	Risk	Status
1	Transportation	Functional	When shortages are discovered, the system can send truck to a supplier or multiple suppliers (destinations) to replenish the inventory.	NTH	Low	Done
2	Transportation	Functional	The system must register every outbound shipment in the shipment management database.	MH	Low	Done
3	Transportation	Non-Functional	The system will allow to characterize transportation by the date, time of truck departure, truck number, driver's name, origin and destinations.	MH	Low	Done
4	Transportation	Functional	For each destination, the truck driver receives a numbered document containing a list of the items being transported to the given destination. The system must store this number in the system for tracking purposes.	MH	Low	Done
5	Transportation	Non-Functional	The system allow each site in the transportation system to store address, a clear phone number, and a contact name.	MH	Low	Done

6	Transportation	Non-Functional	The system allow each truck to characterized by its license plate number, model, net weight (without goods) and maximum weight it can carry.	MH	Low	Done
7	Transportation	Functional	The system must save the weight of the truck before it leaves the origin in the transport form	MH	Low	Done
8	Transportation	Functional	the system must alert if the actual weight exceeds the maximum allowed weight	MH	Low	Done
9	Transportation	Functional	In case of excess weight the system must operate in one of the following cases, the trip is re-planned / one of the destinations is removed/changed / a truck is replaced, or some of the products are removed from the truck	MH	High	Done
10	Transportation	Functional	In case of exceeding the given weight, the step should be reflected in the transport document.	MH	Low	Done
11	Transportation	Functional	The system must assign a driver with an appropriate license to the truck selected for transport	MH	Low	Done
12	Transportation	Non-Functional	The system allows different shipping areas, according to which the transports will be planned for increased efficiency	NTH	High	Done

#	Topic	Issue	Solution
1	Shortages	Who is responsible to send a truck to replenish the inventory ? Does the system do so automatically, or just notify the manager.	The answer given to us was that the manager choose to do so, so the company manager acquires different requests from stores for a shipment, then a manager can select to send out a truck
2	Shortages	How many products need to be in shortage to send a truck ?	<u>Default :</u> the Branch Manager chooses how much to request, no limit or minimum (under 5 hours of coding required)
3	Shipping Areas	Who is responsible to define the shipping areas ?	<u>Default :</u> The Company manager/Console (the user running the program) choose where to pick up the items from (under 5 hours of coding required)
4	Weight overload	Who is responsible to choose the alternative ?	DEFAULT: The Company manager(the user running the program) (under 5 hours of coding required)
5	Weight overload	In the alternative, the system choose what to replace / remove. Or the manager ?	DEFAULT: the manager chooses which items to replace (under 5 hours of coding required)
6	Not Enough supply to drop off	If a store needs a certain amount of items, for example x bananas and y apples, but the truck does not have enough supply to give , what do we do	DEFAULT: we skip the destination completely, even if we a single apple, the destination will not receive it, This case also happens if the truck has enough of every item , except even a single one, then again the truck will not drop off anything (under 5 hours of coding required)

7	Not enough stock to pick up	If the company manager requested x items from supplier A, but A doesn't have that item, or x of those (for each item requested) than what should happen?	DEFAULT: the supplier is skipped, and not a single item requested will be picked up, even if he had enough of a single item, and not enough of the other, none of the items will be picked up (under 5 hours of coding required)
